Find Unique Binary String

→ Unique store

nums = ["01", "10"]

Output = "11".

⇒ Aap ek baar batao

0, 1.

n=1 → 1, 0

n=2 → 11, 00, 10, 01

n=3 → 111, 110, 101, 100, 000, 001, 010, 011

2^n →

⇒ Possible total unique Binary

nums = ["00", "11"]

$2^n > n$ → length.

n=2

$4 > 2$

1, 2

11
00

⇒ Jb bhi unique; missing ho ek bar HashSet lagao

Approach 1 — Generate all unique Binary ~~one by one~~

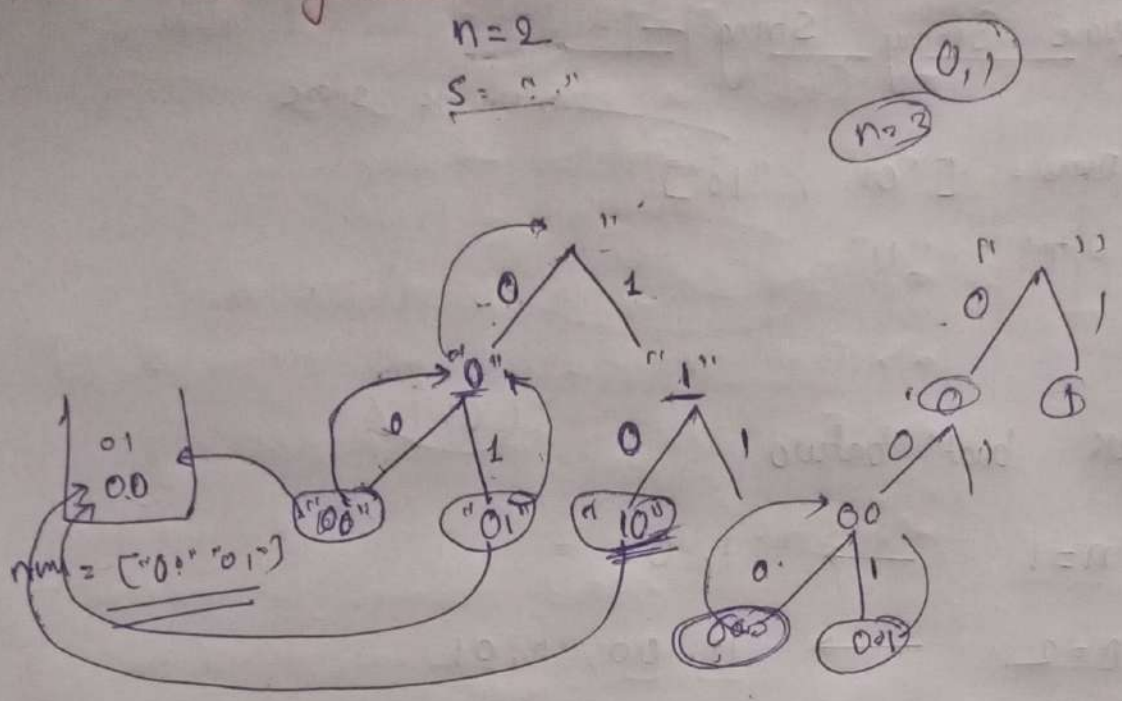
Check in set

• if not match return that string

⇒ How to generate Unique Binary :-

n = 2

S = " "



T.C :- $O(2^n)$

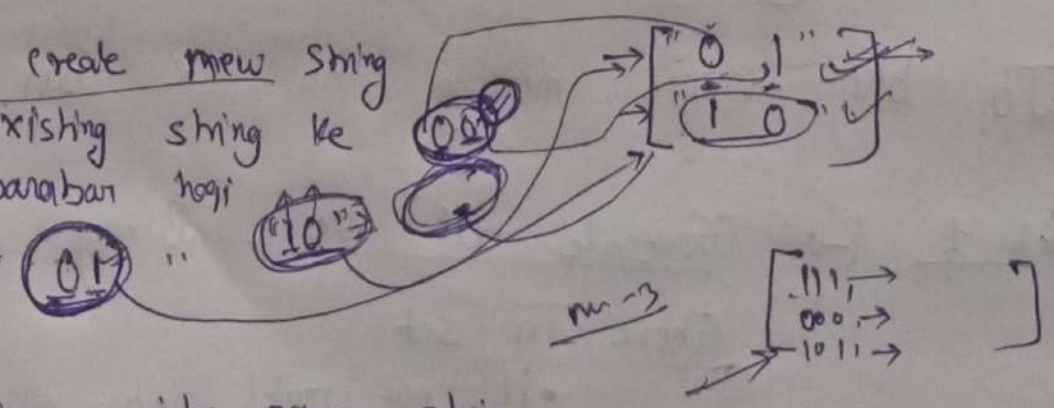
S.C :- $O(n)$ → Recursive

2^n —

Better Approach :- Har Possible string to generate kr rhe the

nums = ["01", "10"]

let we create new string kb existing string ke barabar hogi

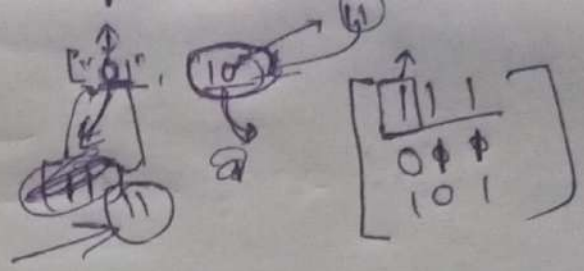


• Every idx same string.

New String :-

⇒ How to make ? :-

• Har string se alg banaye.

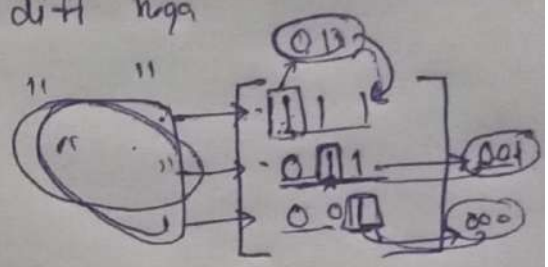


Trick ? Har string के लिए एक specific position delete hoy.

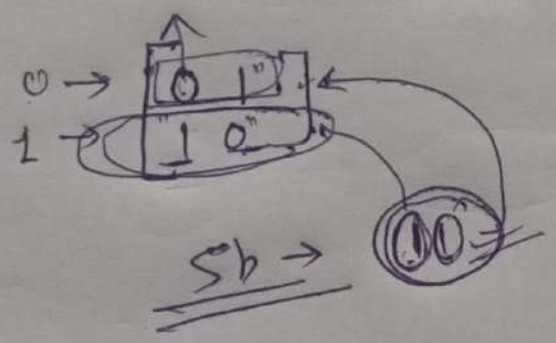
String 0 ⟶ 0 position diff hoga

" 1 ⟶ 1 "

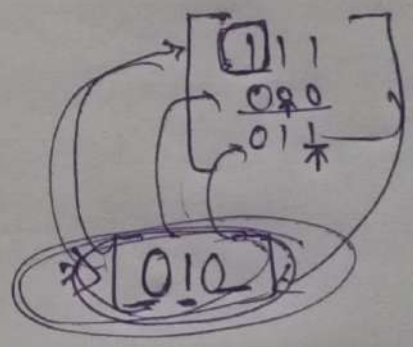
⋮



nums[i] से index i diff make.



0 → 1
1 → 0



nums = ["00", "11"]

Approach 2 :- Take StringBuilder :-

Travel 0 ..... n (i).

Flip char in nums[i] kar ith char.

Append in StringBuilder

Return Convert to String (StringBuilder).

T.C = O(n)

S.C = O(n)
